MONTHLY WEATHER MAP

METEOROLOGICAL SERVICE, DOMINION OF CANADA

NOVEMBER 1936

Over the western grain districts from southwestern Manitoba westward to the Rocky Mountains the month was considerably milder than a normal November. From eastern Manitoba and thence eastward to the Gulf of St. Lawrence and the Labrador coast the month was considerably colder than a normal November. Over the greater part of the Dominion less than the usual amount of precipitation was recorded.

TEMPERATURE

In British Columbia, temperatures averaged a little above normal on the northern portion of Vancouver Island and along the coast northward to the Alaskan panhandle as well as in the northern interior. On the southern portion of Vancouver Island the temperature averaged a little below normal and was either normal or slightly above in the Fraser valley, along Burrard Inlet, and the northern part of the Strait of Georgia. In the Similkameen, Okanagan, Kettle, Kootenay and south Thompson valleys the month averaged about two or three degrees colder than a normal November.

In southern Alberta the excess over normal mean temperature was eight to ten degrees along the Bow, Oldman and St. Mary Rivers. Among the upper tributaries of the Red Deer and the North Saskatchewan Rivers the excess was eight to fourteen degrees and the same was true of the upper Peace River country. In the extreme southeastern corner of Alberta, however, the excess was generally less than six degrees.

In the central portion of the grain region of Saskatchewan the excess was six to nine degrees but in the southern districts was generally less than six degrees while in the eastern portion of the grain region the normal temperature was exceeded by two to four degees.

In Manitoba, in the Red River valley, temperatures averaged about normal but in the southwestern districts were one to four degrees above normal. Along Lake Winnipeg and in the districts east of the Red River temperatures averaged two to five degrees below normal.

In Ontario the greatest deviation below normal occurred in the region between Lake Superior and James Bay, amounting to ten or twelve degrees. In the Lake of the Woods region the deficiency was only two or three degrees but eastward towards Lake Superior negative differences from normal reached six to eight degrees. In the Lower Lake region negative deviations were mostly three to five degrees although locally they reached six or seven degrees.

In Quebec temperatures were four or five degrees below normal along the St. Lawrence River and five to eight degrees below normal on the highlands. On Anticosti Island and along the north shore of the Gulf of St. Lawrence temperatures averaged three degrees below normal.

In northern New Brunswick the month averaged six or seven degrees below normal but along the shore of the Bay of Fundy only two or three degrees below normal. On Prince Edward Island and in the Magdalen Islands the deficiency was two to four degrees. In Nova Scotia the normal temperature was exceeded slightly in the extreme southeast and also on Cape Breton and Sable Islands. On the south shore of the Bay of Fundy and along the Basin of Minas the deficiency was about one degree.

In western and northern Newfoundland the month was one to three degrees colder than usual but in southeastern Newfoundland there was an excess of one to three degrees.

Along the Labrador coast the month averaged five or six degrees below normal and six to nine degrees below normal in Hudson Strait and the Hudson Bay area.

In the Yukon the month averaged five to nine degrees above normal temperature while in the upper Mackenzie valley the excess was three to eight degrees. At the mouth of the Mackenzie, however, the month was colder than usual.

PRECIPITATION

On southern Vancouver Island, in the lower Fraser valley, and along Burrard Inlet and the inner islands, as well as in the southern interior valleys the precipitation was deficient by more than fifty per cent. of the normal amount. In some parts of the lower Fraser valley and in the Okanagan and Kettle valleys the deficiency was more than seventy-five per cent. of the normal. On northern Vancouver Island the deficiency was about thirty per cent. and at Prince Rupert about fifteen per cent. In the upper Fraser valley the deficiency was ten to thirty-five per cent. In the region of the Yellowhead and Rogers Passes the deficiency appears to have been from sixty to eighty per cent.

In southern Alberta the deficiency was thirty to seventy-five per cent. or more in the foothills but only thirty to fifty per cent. in the extreme southeast. In the region of the Peace and Athabaska Rivers precipitation exceeded the normal by fifteen to thiry per cent. and in some parts of the region from Edmonton southward to the divide between the North Saskatchewan and the Red Deer Rivers there were excesses of fifty to seventy-five per cent.

Over the western grain region the greatest deficiencies occurred in Saskatchewan along the north and south branches of the Saskatchewan River, amounting to sixty to eighty per cent. or more. Elsewhere in Saskatchewan the deficiencies varied very much with locality but in general were from thirty to fifty per cent.

In southwestern Manitoba the deficiencies were fifty to seventy-five per cent. but in some parts of southeastern Manitoba the snowfall was locally heavy.

From the Lake of the Woods eastward to Lake Superior the precipitation was mostly deficient by ten to thirty-five per cent. Along the eastern coast of Lake Superior there was an excess of fifteen to seventy-five per cent. and from Lake Abitibi northward to James Bay there was also a very considerable excess over normal. From Lake Temiskaming southward to the Georgian Bay precipitation was deficient by thirty to fifty per cent. at most stations. In the region of the Lower Lakes, the Lower Ottawa and the Upper St. Lawrence valleys precipitation was very spotty but for the most part was twenty-five to thirty-five per cent. below normal

In Quebec immediately along the St. Lawrence River from Montreal to the Saguenay there was an excess over normal precipitation varying from ten to fifty per cent. Immediately north of the St. Lawrence and in the region of Lake St. John most stations reported deficiencies varying from ten to fifty per cent. and averaged approximately fifteen per cent. Along the divide between the St. Lawrence and James Bay drainages there was an excess of fifty per cent. or more.

In central New Brunswick the excess over normal precipitation averaged about thirty-five per cent. but in the region of Passamaquoddy Bay, in the western portion of Prince Edward Island, and on the coast of New Brunswick south of the Bay of Chaleur, as well as along the southern portion of the outer coast of Nova Scotia there were moderate deficiencies averaging about fifteen per cent. Along the southern coast of the Bay of Fundy, in the interior of Nova Scotia, on Cape Breton Island, and the eastern portion of Prince Edward Island normal precipitation was exceeded by twenty to thirty-five per cent. for the most part.

Over the greater part of southern Newfoundland there was an excess of thirty-five to seventy per cent. while in northern Newfoundland precipitation averaged about normal or slightly higher.

The few returns available at present indicate more than a normal precipitation along the west coast of Hudson Bay as well as in the Yukon and along the middle Mackenzie valley.

A. J. CONNOR

SPECIAL REPORTS

NOTE—Column H is Highest Temperature; Column L is Lowest Temperature; Column Tm is the mean temperature of the month; Column P is Precipitation in inches; Column I denotes total of bright sunshine in hours during the month; Column Sg. denotes depth of snow on ground in inches, where given.
